Faisalabad NDVI Classified Crop Health Monitoring

Study Area: Faisalabad District, Punjab, Pakistan
Data Source: Sentinel-2 MSI
Analysis: NDVI

Methodology

Sentinel-2 MSI imagery was used to calculate NDVI for Faisalabad District. The resulting NDVI values were classified into four classes to assess vegetation density and crop health.

NDVI Interpretation

Very Low NDVI: Bare soil, built-up areas, water, or very sparse vegetation.

Low NDVI: Sparse or stressed vegetation with limited crop cover.

Moderate NDVI: Moderate vegetation and crop cover, indicating generally healthy vegetation.

High NDVI: Dense and healthy vegetation with strong crop cover.

Key Findings

Moderate NDVI areas covered the largest share of the classified area (69.82%), followed by High NDVI areas (20.32%). Low NDVI areas accounted for 10.08%, while Very Low NDVI areas accounted for only 0.03%.
