Faisalabad NDVI-Based Crop Health Monitoring

Study Area: Faisalabad District, Punjab, Pakistan
Data Source: Sentinel-2 MSI
Analysis: NDVI

Methodology

Sentinel-2 MSI imagery was used to calculate NDVI for Faisalabad District. NDVI values were classified into five classes to assess vegetation density and crop health.

NDVI Interpretation

Higher NDVI values indicate denser and healthier vegetation, while lower values indicate sparse vegetation or non-vegetated areas.

Key Findings

NDVI mapping highlights spatial differences in vegetation density across Faisalabad District. Areas with higher NDVI values represent denser vegetation, while lower values indicate sparse vegetation or non-vegetated surfaces.
